

Programming with C++

COMP2011: Data Structures — Stack & Queue

Cecia Chan
Cindy Li

Department of Computer Science & Engineering
The Hong Kong University of Science and Technology
Hong Kong SAR, China

- Computer science is the study of how to process information (data) **efficiently** using computers.
- A **data structure** helps store, organize, and manipulate data in a particular way so that they can be processed **efficiently** by computers.
- Different applications require different **data structures**.
- Examples: **array**, **linked list**, **(binary) tree**, **stack**, **queue**, etc.

Stack and Queue

Stack and **queue** let you **insert** and **remove** items at the **ends** only, not in the middle.

Part I

Stack

Stack: How it Works

Consider a pile of cookies.

- more cookies: new cookies are **added** on **top**, one at a time.
- fewer cookies: cookies are **consumed** one at a time, starting at the **top**.

As an **ADT**, insertions and removals of items on a **stack** are based on the *last-in first-out (LIFO)* policy.

It supports:

- **Data**: an **ordered** list of data/items.
- **Operations** (major ones):
 - top** : **get** the value of the **top** item
 - push** : **add** a new item to the **top**
 - pop** : **remove** an item from the **top**

Stack of int Data — stack.h

```
#include <iostream>      /* File: int-stack.h */
#include <cstdlib>
using namespace std;
const int BUFFER_SIZE = 5;

class int_stack
{
private:
    int data[BUFFER_SIZE]; // Use an array to store data
    int top_index;         // Starts from 0; -1 when empty

public:
    // CONSTRUCTOR member functions
    int_stack();           // Default constructor

    // ACCESSOR member functions: const => won't modify data members
    bool empty() const;    // Check if the stack is empty
    bool full() const;    // Check if the stack is full
    int size() const;      // Give the number of data currently stored
    int top() const;       // Retrieve the value of the top item

    // MUTATOR member functions
    void push(int);        // Add a new item to the top of the stack
    void pop();            // Remove the top item from the stack
};
```

Example: Decimal to Binary Conversion — Illustration

- e.g., $26_{(10)} = 11010_{(2)}$

- Algorithm** to convert $N_{(10)} = M_{(2)}$:

Step 1 : divide N by 2 successively

Step 2 : each time **push** the remainder onto a stack

Step 3 : print the answer by **popping** the stack successively

$$\begin{array}{r|l} 2 & 26 \\ \hline 2 & 13 \quad \dots \quad 0 \\ 2 & 6 \quad \dots \quad 1 \\ 2 & 3 \quad \dots \quad 0 \\ 2 & 1 \quad \dots \quad 1 \\ & 0 \quad \dots \quad 1 \end{array}$$

Example: Decimal to Binary Conversion

```
#include "int-stack/int-stack.h" /* File: decimal2binary.cpp */

int main() // Convert +ve decimal number to binary number using an stack
{
    int_stack a;
    int x, number;

    while (cin >> number)
    { // Conversion: decimal to binary
        for (x = number; x > 0; x /= 2)
            a.push(x % 2);

        // Print a binary that is stored on a stack
        cout << number << "(base 10) = ";
        while (!a.empty())
        {
            cout << a.top();
            a.pop();
        }
        cout << "(base 2)" << endl;
    }

    return 0;
} // Compile: g++ -o decimal2binary -Lint-stack decimal2binary.cpp -lintstack
```

Stack of int Data — Constructors, Assessors

```
#include "int-stack.h" /* File: int-stack1.cpp */

    /***** Default CONSTRUCTOR member function *****/
int_stack::int_stack() { top_index = -1; } // Create an empty stack

    /***** ACCESSOR member functions *****/
// Check if the int_stack is empty
bool int_stack::empty() const { return (top_index == -1); }

// Check if the int_stack is full
bool int_stack::full() const { return (top_index == BUFFER_SIZE-1); }

// Give the number of data currently stored
int int_stack::size() const { return top_index + 1; }

// Retrieve the value of the top item
int int_stack::top() const
{
    if (!empty())
        return data[top_index];

    cerr << "Warning: Stack is empty; can't retrieve any data!" << endl;
    exit(-1);
}
```

Stack of int Data — Mutators

```
#include "int-stack.h" /* File: int-stack2.cpp */

    /***** MUTATOR member functions *****/
void int_stack::push(int x) // Add a new item to the top of the stack
{
    if (!full())
        data[++top_index] = x;
    else
    {
        cerr << "Error: Stack is full; can't add (" << x << ")!" << endl;
        exit(-1);
    }
}

void int_stack::pop()          // Remove the top item from the stack
{
    if (!empty())
        --top_index;
    else
    {
        cerr << "Error: Stack is empty; can't remove any data!" << endl;
        exit(-1);
    }
}
```

Part II

Queue

Queue: How it Works

Consider the case when people line up for tickets.

- more people: new customers **join** the **back** of a **queue**, one at a time.
- fewer people: the customer at the **front** buys a ticket and **leaves** the **queue**.

As an **ADT**, insertions and removals of items on a **queue** are based on a ***first-in first-out (FIFO)*** policy.

It supports:

- **Data**: an **ordered** list of data/items.
- **Operations** (major ones):
 - front** : **get** the value of the **front** item
 - enqueue** : **add** a new item to the **back**
 - dequeue** : **remove** an item from the **front**

Circular Queue of int Data — Illustration

Circular Queue of int Data — queue.h

```
#include <iostream>      /* File: int-queue.h */
#include <cstdlib>
using namespace std;
const int BUFFER_SIZE = 5;

class int_queue // Circular queue
{
private:
    int data[BUFFER_SIZE]; // Use an array to store data
    int num_items;         // Number of items on the queue
    int first;             // Index of the first item; start from 0

public:
    // CONSTRUCTOR member functions
    int_queue();           // Default constructor

    // ACCESSOR member functions: const => won't modify data members
    bool empty() const;    // Check if the queue is empty
    bool full() const;     // Check if the queue is full
    int size() const;      // Give the number of data currently stored
    int front() const;     // Retrieve the value of the front item
    // MUTATOR member functions
    void enqueue(int);     // Add a new item to the back of the queue
    void dequeue();        // Remove the front item from the queue
};
```

Circular Queue of int Data — Test Program

```
#include "int-queue.h" /* File: int-queue-test.cpp */

void print_queue_info(const int_queue& a) {
    cout << "No. of data currently on the queue = " << a.size() << "\t";
    if (!a.empty()) cout << "Front item = " << a.front();
    cout << endl << "Empty: " << boolalpha << a.empty();
    cout << "\t\t" << "Full: " << boolalpha << a.full() << endl << endl;
}

int main() {
    int_queue a;    print_queue_info(a);
    a.enqueue(4);   print_queue_info(a);
    a.enqueue(15);  print_queue_info(a);
    a.enqueue(26);  print_queue_info(a);
    a.enqueue(37);  print_queue_info(a);
    a.dequeue();    print_queue_info(a);
    a.enqueue(48);  print_queue_info(a);
    a.enqueue(59);  print_queue_info(a);
    a.dequeue();    print_queue_info(a);
    a.dequeue();    print_queue_info(a);
    a.dequeue();    print_queue_info(a);
    a.dequeue();    print_queue_info(a);
    a.dequeue();    print_queue_info(a);
    return 0;
} /* compile: g++ -L. -o int-queue-test int-queue-test.cpp -lintqueue */
```

Circular Queue of int Data — Constructors, Assessors

```
#include "int-queue.h" /* File: int-queue1.cpp */

        /***** Default CONSTRUCTOR member function *****/
// Create an empty queue
int_queue::int_queue() { first = 0; num_items = 0; }

        /***** ACCESSOR member functions *****/
// Check if the int_queue is empty
bool int_queue::empty() const { return (num_items == 0); }

// Check if the int_queue is full
bool int_queue::full() const { return (num_items == BUFFER_SIZE); }

// Give the number of data currently stored
int int_queue::size() const { return num_items; }

// Retrieve the value of the front item
int int_queue::front() const
{
    if (!empty())
        return data[first];

    cerr << "Warning: Queue is empty; can't retrieve any data!" << endl;
    exit(-1);
}
```

Circular Queue of int Data — Mutators

```
#include "int-queue.h" /* File: int-queue2.cpp */

void int_queue::enqueue(int x) // Add a new item to the back of the queue
{
    if (!full())
    {
        data[(first+num_items) % BUFFER_SIZE] = x;
        ++num_items;
    } else {
        cerr << "Error: Queue is full; can't add (" << x << ")!" << endl;
        exit(-1);
    }
}

void int_queue::dequeue() // Remove the front item from the queue
{
    if (!empty())
    {
        first = (first+1) % BUFFER_SIZE;
        --num_items;
    } else {
        cerr << "Error: Queue is empty; can't remove any data!" << endl;
        exit(-1);
    }
}
```
