

# Topological Sort

Version of September 23, 2016

# Directed Graph

In a **directed graph**, we distinguish between edge  $(u, v)$  and edge  $(v, u)$

- **out-degree** of a vertex is the number of edges **leaving** it
- **in-degree** of a vertex is the number of edges **entering** it
- Each edge  $(u, v)$  contributes one to the out-degree of  $u$  and one to the in-degree of  $v$

$$\sum_{v \in V} \text{out-degree}(v) = \sum_{v \in V} \text{in-degree}(v) = |E|$$

# Usage of Directed Graph

- Directed graphs are often used to represent **order-dependent** tasks
  - That is, we cannot start a task before another task finishes
- Edge  $(u, v)$  denotes that task  $v$  cannot start until task  $u$  is finished

- Clearly, for the system not to hang, the graph must be **acyclic**
  - It must be a **directed acyclic graph (or DAG)**

# Topological Sort

- A **Topological ordering** of a graph is a linear ordering of the vertices of a DAG such that if  $(u, v)$  is in the graph,  $u$  appears before  $v$  in the linear ordering
- e.g., order in which classes can be taken

- Topological ordering may not be unique as there are many “equal” elements!
- E.G., there are several topological orderings
  - 0, 6, 1, 4, 3, 2, 5, 7, 8, 9
  - 0, 4, 1, 6, 2, 5, 3, 7, 8, 9
  - ...

# Topological Sort Algorithm

- Observations
  - A DAG must contain at least one vertex with in-degree zero (why?)
- Algorithm: **Topological Sort**
  - ➊ Output a vertex  $u$  with in-degree zero in current graph.
  - ➋ Remove  $u$  and all edges  $(u, v)$  from current graph.
  - ➌ If graph is not empty, goto step 1.
- Correctness
  - At every stage, current graph is a DAG (why?)
  - Because current graph is always a DAG, algorithm can always output some vertex. So algorithm outputs all vertices.
  - Suppose order output was **not** a topological order. Then there is some edge  $(u, v)$  such that  $v$  appears before  $u$  in the order. This is impossible, though, because  $v$  can not be output until edge  $(u, v)$  is removed!

# Topological Sort Algorithm

## Topological\_sort( $G$ )

```
Initialize  $Q$  to be an empty queue;  
foreach  $u$  in  $V$  do  
    if  $\text{in-degree}(u) = 0$  then  
        // Find all starting vertices  
        Enqueue( $Q, u$ );  
    end  
end  
while  $Q$  is not empty do  
     $u = \text{Dequeue}(Q)$ ;  
    Output  $u$ ;  
    foreach  $v$  in  $\text{Adj}(u)$  do  
        // remove  $u$ 's outgoing edges  
         $\text{in-degree}(v) = \text{in-degree}(v) - 1$ ;  
        if  $\text{in-degree}(v) = 0$  then  
            Enqueue( $Q, v$ );  
        end  
    end  
end
```

# Example

$Q = \{\}$

$Q = \{0\}$

# Example

$Q = \{6, 1, 4\}$

Output: 0

$Q = \{1, 4, 3\}$

Output: 0, 6

# Example

$Q = \{4, 3, 2\}$

Output: 0, 6, 1

$Q = \{3, 2\}$

Output: 0, 6, 1, 4

# Example

$Q = \{2\}$

Output: 0, 6, 1, 4, 3

$Q = \{7, 5\}$

Output: 0, 6, 1, 4, 3, 2

# Example

$Q = \{5, 8\}$

Output: 0, 6, 1, 4, 3, 2, 7

$Q = \{8\}$

Output: 0, 6, 1, 4, 3, 2, 7, 5

# Example

9

$Q = \{9\}$

Output: 0, 6, 1, 4, 3, 2, 7, 5, 8

$Q = \{\}$

Output: 0, 6, 1, 4, 3, 2, 7, 5, 8, 9

Done!

# Topological Sort: Complexity

- We never visit a vertex more than once
- For each vertex, we examine all outgoing edges
  - $\sum_{v \in V} \text{out-degree}(v) = E$
- Therefore, the running time is  $O(V + E)$

## Question

Can we use DFS to implement topological sort?
